

API Testing Report

Yasin Shaik

Syncaura Backend

Summary Overview

Intern 12

Module: Complaints & Notifications

Date: 23 June 2026

File	Endpoints Tested	Status
<code>complaintRoutes.js</code>	2	All working successfully after parameter verification.
<code>notificationRoutes.js</code>	1	Functional, successfully tracking authenticated user instances.

Module 1: Complaints

File: `complaintRoutes.js`

Base URL: `/api/complaints`

Endpoints Tested

#	Method	Endpoint	Status Code	Result
1	POST	/api/complaints	201	Complaint filed successfully with automatic tracking.
2	GET	/api/complaints/my-complaints	200	Returns filtered array of complaints filed by the current user.

Test Activity Logs

1. Creating a Complaint

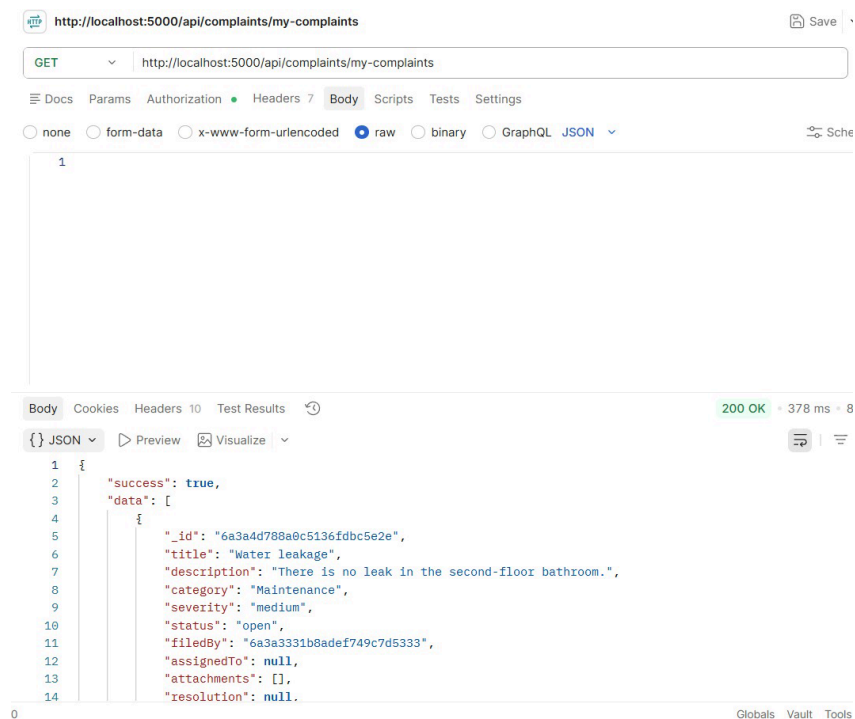

- **Initial Attempt:** Ran into a **404 Not Found** error due to an incorrect prefix inclusion (/api/auth/complaints).
- **Validation Check:** Encountered a **400 Bad Request** state indicating "Title, description, and category are required" when omitting expected parameters.
- **Enum Validation Check:** Encountered a **500 Internal Server Error** due to strict schema validation rules targeting non-conforming parameters.
- **Final Correction:** Sent with complete body variables matching the explicit enum layout.
- **Success Log:**

```
JSON
{
```

```

"success": true,
"message": "Complaint filed successfully",
"data": {
  "title": "Water leakage",
  "description": "There is no leak in the second-floor bathroom.",
  "category": "Maintenance",
  "severity": "medium",
  "status": "open",
  "filedBy": {
    "_id": "6a3a3331b8adef749c7d5333",
    "name": "Yasin Shaik",
    "email": "yasinhaik325@gmail.com",
    "role": "user"
  }
}
}
}

```

2. Fetching User Specific Complaints

- **Initial Attempt:** Sent via an incorrect `POST` method structure which resulted in an implicit route fallback `404`.
- **Correction:** Switched request context to a raw `GET` payload layout.

- **Success Log:**

JSON

```
{
  "success": true,
  "data": [
    {
      "_id": "6a3a4d788a0c5136fdb5e2e",
      "title": "Water leakage",
      "description": "There is no leak in the second-floor bathroom.",
      "category": "Maintenance",
      "severity": "medium",
      "status": "open",
      "filedBy": "6a3a3331b8adef749c7d5333",
      "assignedTo": null,
      "attachments": [],
      "resolution": null
    }
  ]
}
```

Module 2: Notifications

File: `notificationRoutes.js`

Base URL: `/api/notifications`

Endpoints Tested

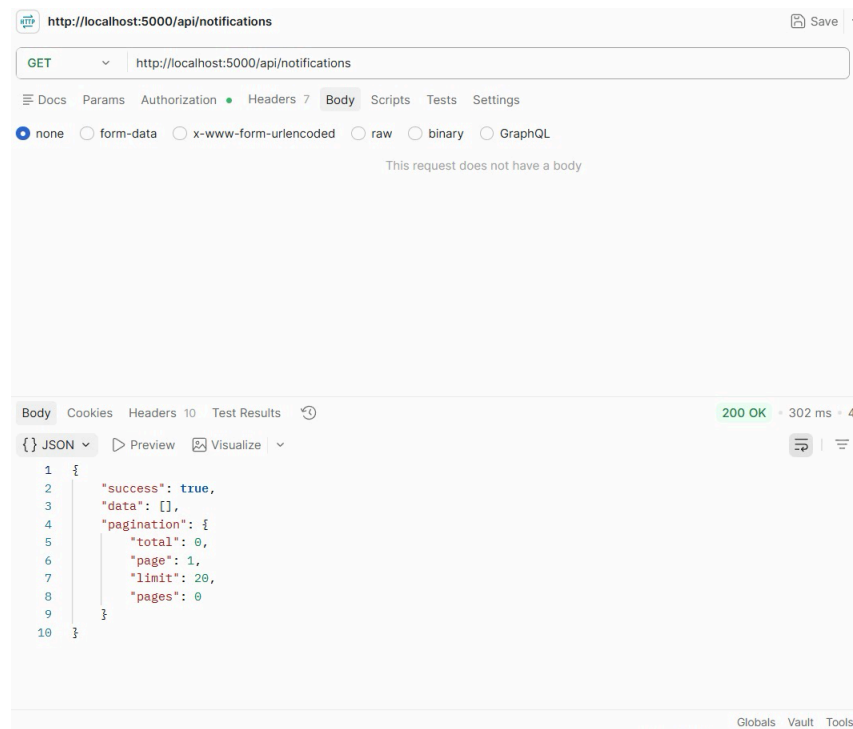

#	Method	Endpoint	Status Code	Result
1	GET	<code>/api/notifications</code>	200	Successfully verified paginated structural response.

Test Activity Logs

- **Success Log:**

JSON

```
{
  "success": true,
  "data": [],
  "pagination": {
    "total": 0,
    "page": 1,
    "limit": 20,
    "pages": 0
  }
}
```

Issues & Findings Summary

1. Environment Configuration Conflict (Resolved)

- **Issue:** Tokens systematically expired within milliseconds of generation, triggering a persistent **Invalid or expired token** block.
- **Root Cause:** A duplicate configuration line sequence within the **.env** context (**JWT_ACCESS_EXPIRES=21**)

overrode the intended `15m` parameter flag, rendering the token life cycle to 21ms instead of minutes.

- **Severity:** High
- **Resolution:** Removed the redundant downstream `.env` lines and initialized a server boot refresh cycle.

2. URL Path Configuration (Resolved)

- **Issue:** Initial payload route mappings failed directly at endpoint entry stages (`404 Not Found`).
- **Root Cause:** Merging independent path contexts inside the client interface (`/api/auth/complaints` instead of `/api/complaints`).
- **Severity:** Medium
- **Resolution:** Re-aligned route mapping syntax down to pure resource paths.

What Worked Correctly

- **Authentication Middleware Hooks:** The core auth middleware (`router.use(auth)`) securely blocks requests lacking active authorization credentials, returning accurate token exception states.
- **Automated Data Binding:** Server correctly maps current identity metadata fields (`filedBy`, `status`, `severity`) down to new model objects dynamically without client input requirements.

☑ **Overall Status: Fully Functional & Verified**
